STEP 3 OF 4 · ADD-ONS

Add-ons as a dropdown, not a wall of cards.

A UI proposal for the customer print request. One add-ons field opens the shop's supplies list; whatever the customer picks drops into a short editable list, and the totals feed Step 4 exactly as they do today.

> **The ask.** “Make the Step 3 add-ons of the customer print request a dropdown style instead.” — reviewer, November 2026

What changes

The card-per-add-on grid is replaced by a single **Add-ons** field. Opening it lists the supplies the shop actually stocks, with price, unit and stock. Chosen items move into a compact list where quantities are set. The step stops growing as the catalog grows.

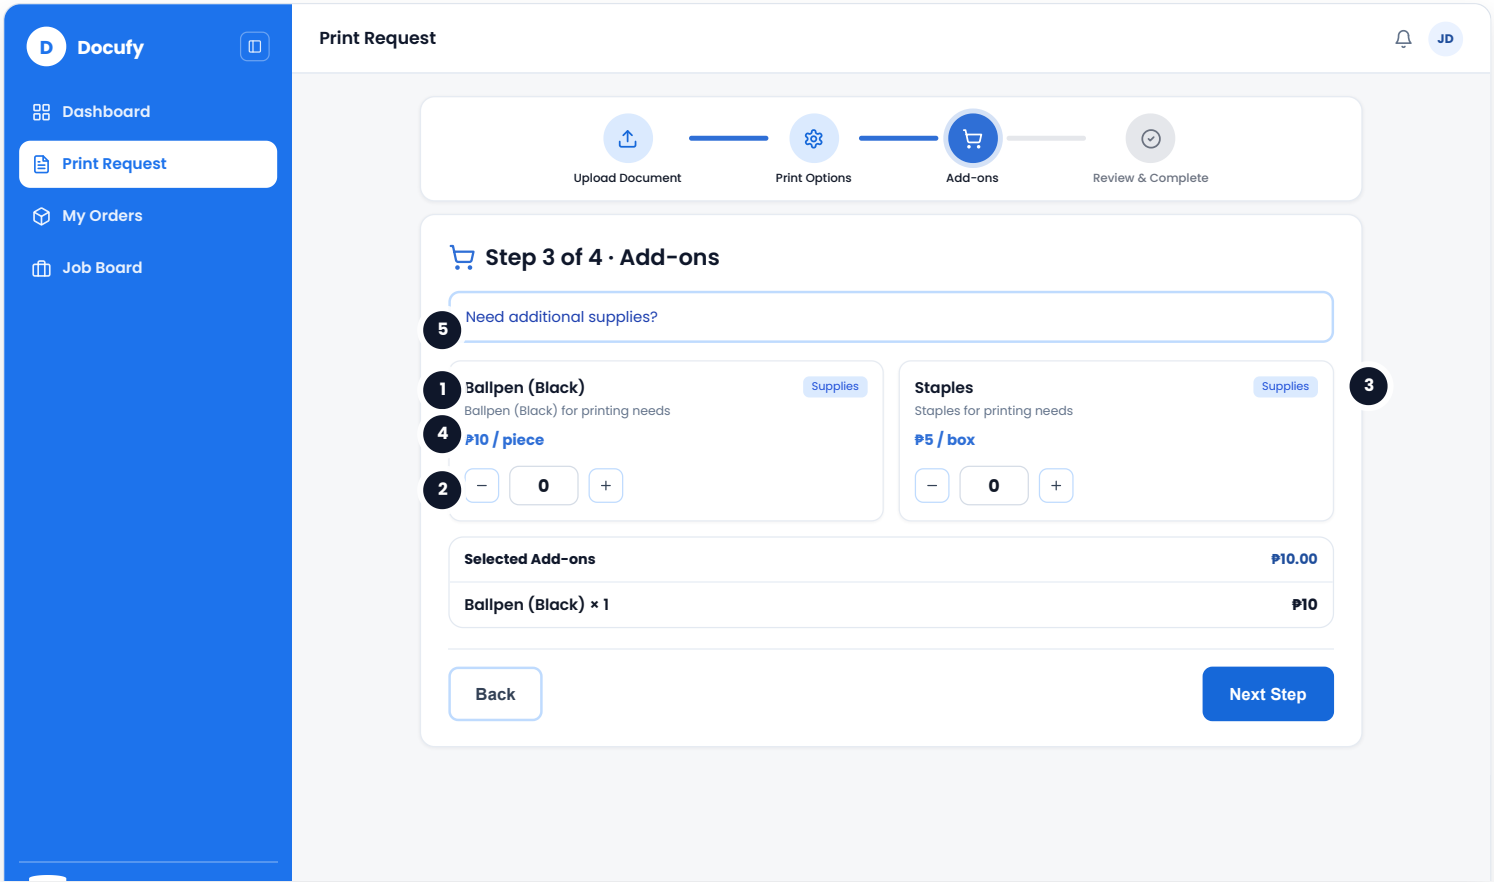

What does not change

Add-ons stay optional. The price rule (unit price × quantity), the `selectedAddons` payload, the Step 4 breakdown and the admin-managed inventory list are untouched. The step still sits between Print Options and Review & Complete.

7 Choices for the reviewer ..... decisions

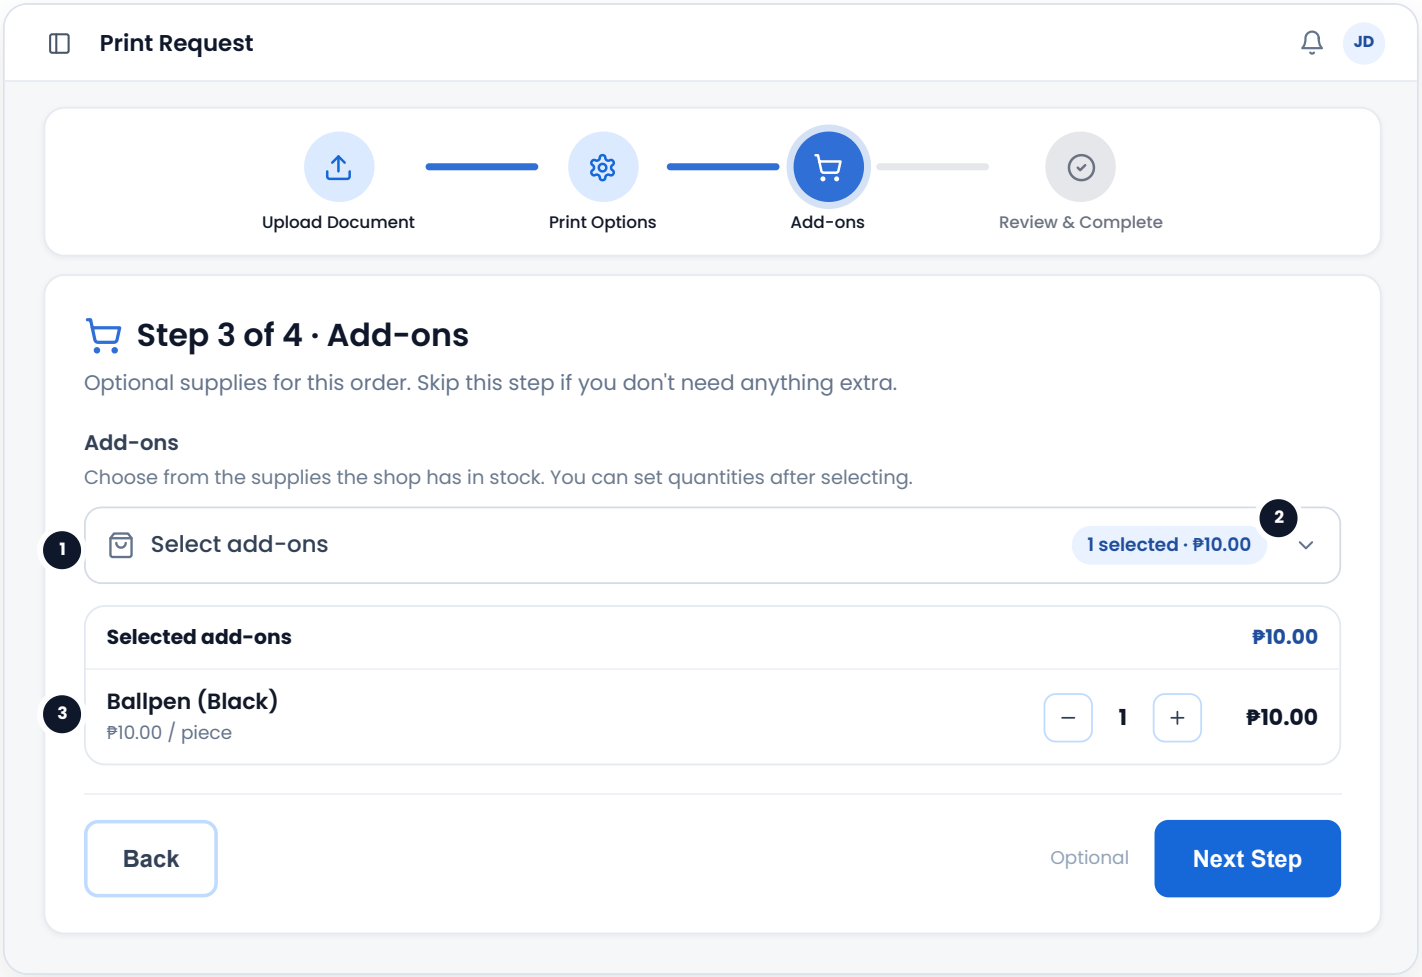

Prototype only No application code has been changed. The real screen is in `src/app/components/shared/PrintTransaction.tsx`, step 3.

Every add-on is always on screen

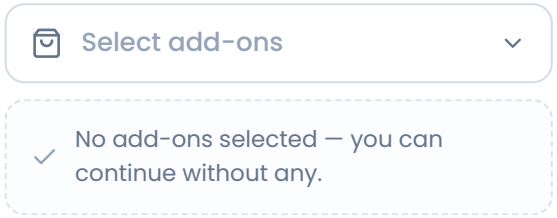

The step renders one full card per add-on in the inventory's Add-ons category, each carrying its own quantity controls, even when the customer wants none of them.

1. **Every add-on is always expanded.** The step is as long as the shop's catalog, so a customer looking for one item reads every card first.
2. **Quantity controls appear at zero.** A card with a - 0 + row reads as something to configure, not something to add — and it repeats on every card.
3. **The "supplies" chip is internal.** It is the inventory category, not a distinction a customer chooses by.
4. **Stock is known but not shown.** The store already flags `inStock`, yet an out-of-stock add-on looks exactly like a selectable one.
5. **Two boxes say the same thing.** "Need additional supplies?" repeats the step title, and the total only appears after something is already chosen.
6. **Optional is never stated.** Nothing on the screen tells the customer they can move on without picking anything.

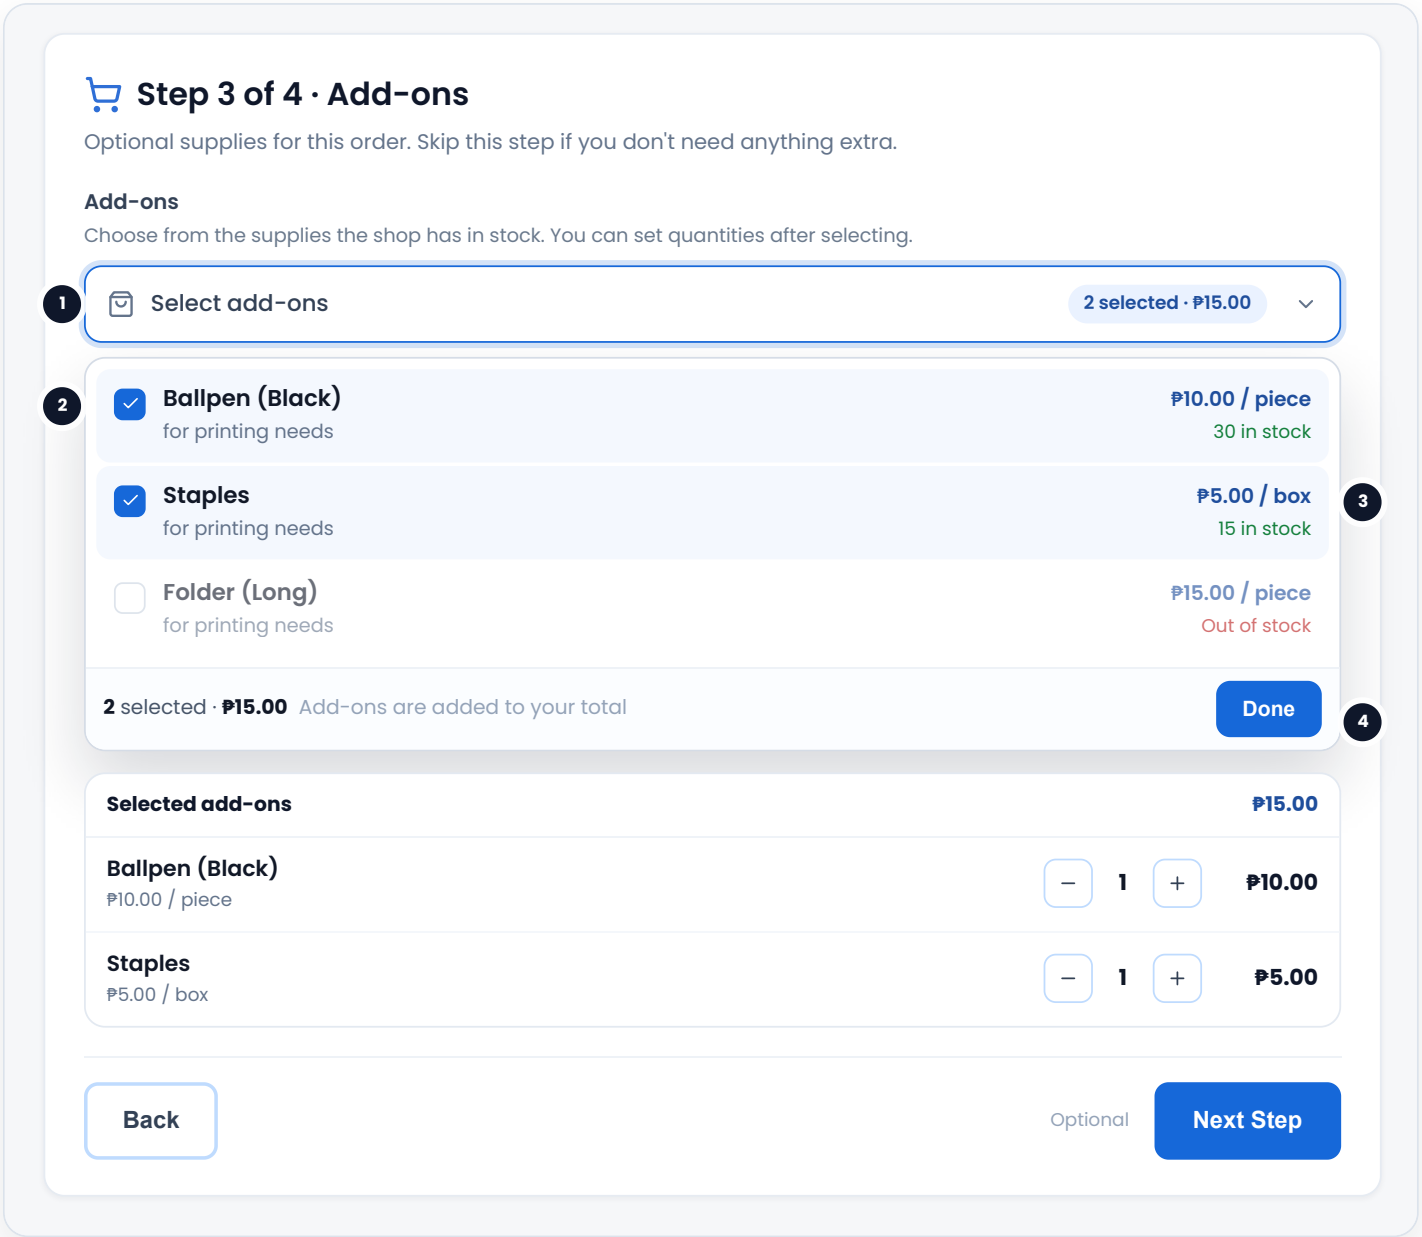

1. **One field replaces the grid.** It reads "Select add-ons" and stays one line tall no matter how many supplies the shop stocks.
2. **The field carries the answer.** "1 selected · ₱10.00" means the customer never has to scroll to know what is on the order or what it costs.
3. **Chosen items become rows.** Name, unit price, a -/+ stepper and the line total, in one card that also prints the running total.
+. **Empty is a valid state.** With nothing picked the field reads "Select add-ons" and a quiet line says the step is optional, so Continue is never a guess.

Empty state

Add-ons total is still derived as **unit price × quantity** and is passed to Step 4 unchanged. No price, stock or order logic is proposed here.

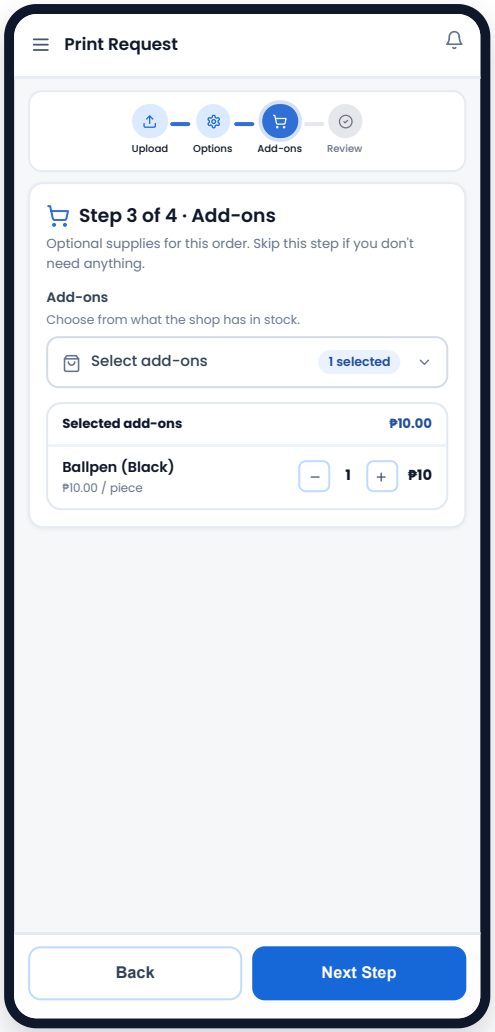

1. **The field is the control.** Blue border and halo while the list is open; the count and running total stay visible next to it.
2. **One row per supply.** A checkbox, the name, and what it is — picking is a toggle, and several can be picked without reopening the list.
3. **Price, unit and live stock on the row.** "Out of stock" disables the row instead of letting the customer order something the shop cannot give.
4. **The panel answers before it closes.** "2 selected · ₱15.00" plus Done. Done, Esc or a click outside closes it and returns focus to the field.

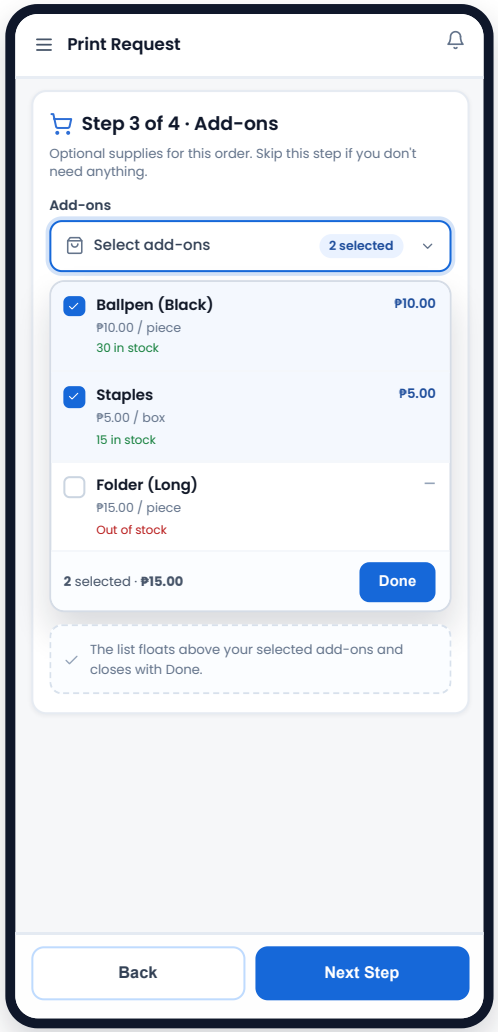

Drawn expanded for clarity

In the app this panel floats over the selected list below it — the step keeps its height instead of pushing the buttons down. It is anchored to the field, not the page, so it never opens somewhere else on screen.

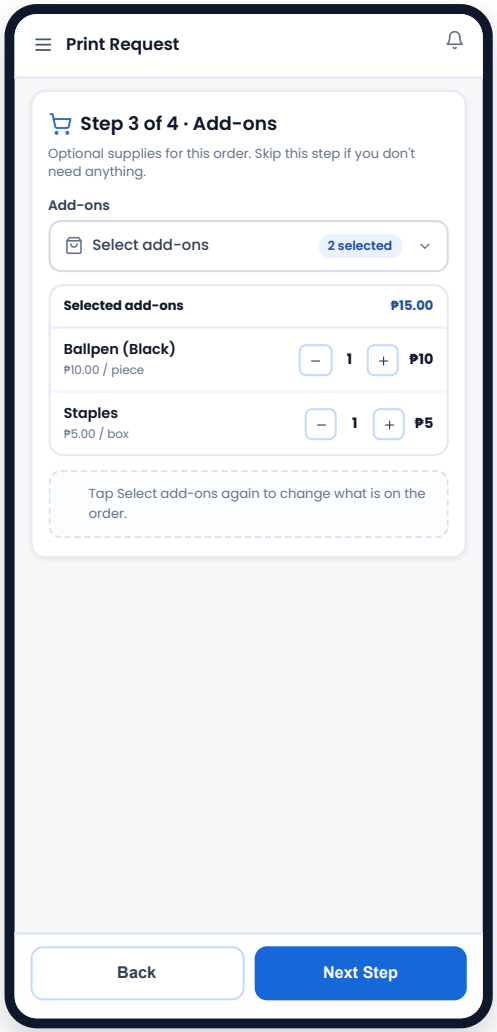

Rows are 52–56 px so they stay tappable. The list scrolls inside the panel once the shop stocks more than roughly five add-ons; the page itself does not jump.

Closed · field + chosen rows

Open · list anchored under the field

After choosing · Done closed the list

Not a full-screen takeover. The list is a card anchored under its field with a shadow — the customer still sees the step around it, and there is no scrim to dismiss.

Thumb-sized rows. 52 px rows with the whole row as the target, so the checkbox does not have to be hit exactly. Done stays pinned at the panel's foot.

One thumb, one column. The field, the chip, the rows and the steppers all fit 390 px without horizontal scroll; the sticky Back / Next Step bar is untouched.

How it would actually work

Everything below happens on the customer print request only. The staff walk-in flow shares the same component, so it would inherit the change unless we gate it.

STATE	WHAT THE CUSTOMER SEES AND WHAT HAPPENS
Nothing selected	The field reads **Select add-ons** with no count chip. Under it, one quiet line: “No add-ons selected — you can continue without any.” The step never blocks Next.
List open	The field takes a blue border and halo. The panel opens directly under it, listing only active Add-ons items from the inventory with unit price and live stock. Picking a row adds it with quantity 1 and keeps the panel open, so several can be picked in one go.
Selecting / unselecting	A tap anywhere on the row toggles it. Selected rows are tinted and carry a check. The panel footer and the field chip update the moment a row changes.
Closing	**Done**, `Esc`, or a click/tap outside the panel. Focus returns to the field. The chosen items stay in the list below.
Quantity	-/+ in steps of 1; line and card totals update live, and going below 1 removes the item. Quantity stays typeable as it is today — someone ordering 25 pens should not tap 24 times.
Out of stock	Row stays visible but disabled, with “Out of stock” in red — hiding it makes a supply the shop normally carries look discontinued. An item already selected when stock runs out keeps its row with a red note and can be removed; the order is never silently changed.
No add-ons at all	The existing empty state is kept (“No add-ons are currently available.”), and the field is not rendered.
Many add-ons	The list scrolls inside the panel (max ~5 rows) instead of lengthening the page. Past roughly 8 items, a small search box goes at the top of the panel — not before.
Keyboard / screen reader	The field is a button with `aria-expanded`, labelled “Add-ons, 1 selected”. The panel is a labelled group of checkboxes, so Space toggles and arrow keys read naturally; nothing depends on hover.
Totals	Unchanged: unit price × quantity, summed into the card total and into Step 4's “Add-ons” line. No new money rule.

Copy

- **Label:** Add-ons
- **Helper:** Choose from the supplies the shop has in stock. You can set quantities after selecting.
- **Placeholder:** Select add-ons
- **Chip:** 1 selected · ₱10.00
- **Panel footer:** 2 selected · ₱15.00
- **Empty:** No add-ons selected — you can continue without any.
- **Stock:** 30 in stock / Out of stock

Kept from today

- Add-ons remain optional; nothing new blocks Next Step.
- The list still comes from inventory's Add-ons category, so admins keep controlling it by adding or archiving items.
- The step keeps its number and place: Step 3 of 4, between Print Options and Review.
- Selected add-ons still appear on Step 4 and on the order/receipt exactly as they do now.
- No change to `selectedAddons`, pricing, stock deduction or the order payload.

Four things to confirm

The mockups use the recommendation in each row. Say the word if any should go the other way before this is built.

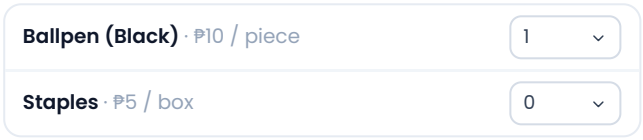

1 · How the dropdown is shaped

Recommended: A

A · One picker for the whole step. A single field lists every add-on and builds a selected list below it. Short, consistent, and it does not grow with the catalog.

B · One dropdown per add-on. Every add-on keeps a row and only the quantity is a dropdown. Closer to "dropdown" in the narrowest sense, but the step still grows with the catalog and the range hides inside a menu.

Variant B, for comparison:

2 · Quantity editing

Recommend: -/+ stepper on each selected row, and the number stays typeable. Stepper is what phones need; typing is what a 25-piece order needs.

Alternative: dropdown of 1–10. Rejected because it caps the order and adds a tap for every change.

3 · Out-of-stock add-ons

Recommend: show them, disabled, with "Out of stock". The inventory already knows; the customer should too, rather than wonder where a supply went.

Alternative: hide them until restocked — fewer rows, but the catalog looks like it changes at random.

4 · Where the total lives

Recommend: both ends — a running chip on the field (`2 selected · ₱15.00`) and the total in the selected list's header. Step 4 keeps its own Add-ons line, unchanged. The step should never make the customer open it to see what it has cost them.

Also worth deciding

- **Does this apply to the staff walk-in flow too?** It shares the component. Recommendation: yes — one add-ons experience in both flows.
- **"Next Step" label.** Recommendation: keep it, and lean on the helper line for "optional" rather than renaming the button for one step.
- **Search inside the panel.** Recommendation: only once the shop actually stocks more than ~8 add-ons; adding it now would be a field that is usually empty.
- **The internal "supplies" chip.** Recommendation: drop it from the customer side; the category already decides what appears here.

The change stays inside the step-3 block of `src/app/components/shared/PrintTransaction.tsx`, reusing the existing `selectedAddons` state and totals. No store, pricing or order changes are needed.
